Special Report: The efficacy of interventions to change physician prescribing behavior

BlueCross BlueShield Association

Record Status
This is a bibliographic record of a published health technology assessment. No evaluation of the quality of this assessment has been made for the HTA database.

The BlueCross BlueShield Association Technology Evaluation Center website (www.bcbs.com/tec) includes the most recent 3 years of TEC Assessments. To request older reports, please use the “contact us” feature on the website.

Citation

Authors’ objectives
The objective of this Special Report is to evaluate the evidence on interventions to change physician prescribing behavior.

Authors’ conclusions
The evidence from this review demonstrates that interventions intended to change provider behavior can be successful, in spite of the numerous challenges inherent in achieving this goal. This review also suggests that certain factors can contribute to program success, but that no single factor, or factors, is overwhelmingly a determinant of success. It is likely that numerous factors, including clinical factors, demographics, and features of the intervention, interact to determine overall impact. This review highlights the need to take a broad view in considering all potential contributing factors to maximize the potential benefit of an intervention.
