Intravenous immunoglobulin for children with HIV infection

Record Status
This is a bibliographic record of a published health technology assessment. No evaluation of the quality of this assessment has been made for the HTA database.

Citation
Intravenous immunoglobulin for children with HIV infection. Lansdale: HAYES, Inc.. Directory Publication. 2006

Authors' objectives
Intravenous immunoglobulin (IVIG) therapy is used to provide passive immunity or to alter the immune response by increasing an individual's antibody titer and antigen-antibody reaction potential. IVIG has been investigated as a method of prevention and treatment of serious and/or recurrent bacterial infections in children infected with human immunodeficiency virus (HIV).
