Cross-trimester repeated measures testing for Down's syndrome screening: an assessment

Record Status
This is a bibliographic record of a published health technology assessment from a member of INAHTA. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

Authors' conclusions
Study found evidence of increased detection rates and reduced false-positive rates from cross-trimester repeated measures testing in screening for Down's syndrome, but potential benefits need to be confirmed prospectively
