Interventions to treat premature ejaculation: a systematic review short report
Cooper K, Martyn-St James M, Kaltenthaler E, Dickinson K, Cantrell A

Record Status
This is a bibliographic record of a published health technology assessment from a member of INAHTA. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

Authors' objectives
To systematically review evidence for clinical effectiveness of behavioural, topical and systemic treatments for PE.

Authors' conclusions
Several interventions significantly improved IELT. Many interventions also improved sexual satisfaction and other outcomes. However, assessment of longer-term safety and effectiveness is required to evaluate whether or not initial treatment effects are maintained long term, whether or not dose escalation is required, how soon treatment effects end following treatment cessation and whether or not treatments can be stopped and resumed at a later time. In addition, assessment of the AEs associated with long-term treatment and whether or not different doses have differing AE profiles is required.
