Cost-effectiveness of the carbon-13 urea breath test for the detection of Helicobacter pylori: an economic analysis
Masucci L, Blackhouse G, Goeree R

Record Status
This is a bibliographic record of a published health technology assessment from a member of INAHTA. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

Authors' conclusions
Results indicate that the 2-step strategy could be economically attractive for the testing of H. pylori. However, testing with the 2-step strategy will cost the Ministry of Health and Long-Term Care $4.7 million more than with the ELISA serology test.
