Monotherapy versus combination therapy for adults hospitalized for community-acquired pneumonia: a rapid review

Health Quality Ontario

Record Status
This is a bibliographic record of a published health technology assessment from a member of INAHTA. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

Authors' objectives
The objective of this rapid review is to assess the effectiveness of monotherapy versus combination therapy in adults hospitalized with community-acquired pneumonia (CAP).

Authors' conclusions
Based on the results of this rapid review, there does not appear to be a significant difference in mortality or treatment failure in hospitalized patients receiving monotherapy versus combination therapy for community-acquired pneumonia. A broader evidence-based analysis of the literature may alter these results.
