Diazoxide choline controlled-release for Prader-Willi syndrome – first line

NIHR HSRIC

Record Status
This is a bibliographic record of a published health technology assessment. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

Authors’ conclusions
Diazoxide choline is a new drug to treat Prader-Willi syndrome. Prader-Willi syndrome is a rare genetic disorder that causes people to eat uncontrollably and become obese. It may also cause learning difficulties and behavioural problems. Diazoxide choline is a slow release tablet that is taken by mouth. Some studies have suggested that diazoxide choline may help people with Prader-Willi syndrome to control their eating.
