CRASH-2 (Clinical Randomisation of an Antifibrinolytic in Significant Haemorrhage) intracranial bleeding study: the effect of tranexamic acid in traumatic brain injury - a nested randomised, placebo-controlled trial

Record Status
This is a bibliographic record of a published health technology assessment from a member of INAHTA. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

Authors' conclusions
Study to evaluate the effect of tranexamic acid in traumatic brain injury patients found that neither moderate benefits nor moderate harmful effects can be excluded and that, although uncertainty remains, tranexamic administration might improve outcome in traumatic brain injury patients.
