Duodenojejunal Bypass Liner bei Adipositas mit/ohne Diabetes Mellitus Typ 2 [Duodeno-jejunal bypass liner (DJBL) for patients with obesity, with/without type 2 diabetes mellitus]

Fischer S, Zechmeister-Koss I, Huic M

Record Status
This is a bibliographic record of a published health technology assessment from a member of INAHTA. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

Authors' objectives
This systematic review evaluates the efficacy and safety of the duodenal-jejunal bypass liner (DJBL) for the treatment of a) patients with obesity ≥ grade II with or ≥ grade III without comorbidities and b) patients with Type 2 diabetes mellitus + obesity ≥ grade I. The DJBL is a minimal-invasive method to reduce body weight and to control Type 2 diabetes mellitus (Type 2 DM). The device is a 60 cm long synthetic sleeve, which is endoscopically delivered into the duodenum and a small part of the jejunum.

Authors' conclusions
The analysed studies suggest a short-term reduction of body weight in obese patients. Overall, the available evidence is insufficient to assess the efficacy and safety of the intervention for the treatment of patients with obesity (+ comorbidities) or Type 2 diabetes mellitus + obesity. Currently, inclusion into the hospital benefit catalogue is not recommended. We propose re-evaluation in 2016 when results from studies that assess the commercialised version of the DJBL will be available.
