Hyperbaric oxygen therapy for the treatment of idiopathic sudden sensorineural hearing loss

Record Status
This is a bibliographic record of a published health technology assessment from a member of INAHTA. No evaluation of the quality of this assessment has been made for the HTA database.

Citation

 Authors’ conclusions
Low quality evidence suggests that hyperbaric oxygen therapy in association with drug therapy could have a small benefit of questionable clinical relevance in improving hearing threshold of patients with idiopathic sudden sensorineural hearing loss. In regards to second line treatment, hyperbaric oxygen therapy has shown to have a similar effect to the administration of intratympanic glucocorticoids. Most of clinical practice guidelines do not recommend its routine use. Most of consulted health sponsors of Latin America, Europe and the United States do not provide coverage.
